

Shi (勢)–Dependencia

An initial Foundation read: Realism and Critical political economy

Your recorded position gives power more weight than the independent force of rules. The strategic position leans toward setting limits on pressure and avoiding overextension. The normative position leaves the threshold for overriding established order unresolved.

Answer 5 targeted items

Both readings remain live in the current item set. The registered reading summarizes the model output while targeted follow-up items test the boundary between them.

An arms-control bargain under pressure

Suppose two rivals offer reciprocal inspections at declared facilities. Undeclared sites remain possible, and compliance requires a real concession from each side.

The power-centered argument asks which actors can enforce the agreement and why they would continue to do so. The existence of a written obligation is insufficient. The restraint position adds a reason to preserve a limited bargain even if it leaves some advantage unused.

The strongest objection

The strongest rival argument is that information and reciprocal access can sustain cooperation even without a single powerful enforcer.

What would change the argument. The argument changes if inspections reveal violations soon enough to matter, or if the concession materially changes one side's ability to coerce the other.

An illustrative application of the reasoning. This is not a recorded answer or a prediction.

The next question. Would you accept verified limits at declared sites if neither side could rule out undeclared facilities? Which concession would make you refuse?

Chapter 01

Why Realism rather than Critical political economy

The political-economy challenge is that hierarchy and dependence may be doing more work than diplomacy admits. The rows below locate your recorded positions alongside the two readings' authored emphases.

Nearest modeled alternative			
DIMENSION	REALISM	CRITICAL POLITICAL ECONOMY	YOU
Security rivalry	Rivalry	Reassurance	4.5
Reassurance — Rivalry			
Markets and dependence	No strong model emphasis	Markets and dependence	3.5
Security and diplomacy — Markets and dependence			
Domestic politics	No strong model emphasis	Domestic politics	4.5
System pressure — Domestic politics			
These are authored model emphases, not measured expectations about people.			

Chapter 02

The exact terms in the family comparison

The largest positive term comes from Security rivalry. This is where the recorded pattern most supports Realism relative to Critical political economy. Each row is one term in the live scorer's Realism minus Critical political economy comparison. A positive term adds to the first reading's score relative to the second. A negative term subtracts from it.

This calculation uses the calibration registered for the exact completed form. It does not treat distance from the raw scale midpoint as classification evidence.

Realism minus Critical political economy		
Security rivalry		+0.415
Identity and legitimacy		+0.252
Institutions and rules		-0.242
Markets and dependence		+0.230
Domestic politics		-0.223
Restraint and advantage		-0.213
Order and justice		-0.210
Positive terms count toward Realism; negative terms count toward Critical political economy. Values are shown to three decimal places. The deterministic test also reconciles the scorer's final two-decimal rounding step.		

Chapter 03

Where this reading sits in the registered matrix

Your recorded position gives power more weight than the independent force of rules. The strategic position leans toward setting limits on pressure and avoiding overextension. The normative position leaves the threshold for overriding established order unresolved. The highlighted readings combine that strategic posture with Realism and Critical political economy as nearby explanations. Their proximity is a reason to examine the rival argument, not to treat the name as a fixed identity.

The matrix is a reference system. It does not rank people or assign a population category.

Chapter 04

The submitted choices that can be shown here

A result generated in this browser can keep up to three derived evidence records from the exact submitted answer set. The result URL does not contain those records or the underlying answers.

Shared, legacy, deleted, and tuple-mismatched records remain unavailable. The page does not reconstruct evidence from the dimension scores alone.

Chapter 05

Domain inventories remain separate records

Security, Technology, and AI Governance ask narrower questions on their own scales. A similar label or number does not create a reviewed relationship with this Foundation result.

The cards report only what is saved on this device. Profile keeps completed domain inventories beside the Foundation without averaging them into a master score.

Test the reading against a reviewed case

A case can reveal which consideration takes priority when the baseline leaves a tension unresolved. The evidence window and rival interpretation remain part of the case record.

This is a pressure test for the reading. The case does not prove that the registered name is a lasting identity.

Reviewed historical case

Arms-control verification

INF Treaty Verification Regime

When a verified arms-control regime later collapses, does that show that institutions failed, or that they worked only while the political bargain held?

The case separates faith in verification from faith that rules can survive a deeper strategic break.

The limits stay attached to the result

This inventory compares answers with four authored tradition profiles. It makes no reliability, validity, or population claim, and it does not establish a durable personal trait.

The public method describes the Foundation robustness diagnostic, including its constructed inputs and greater sensitivity near family and blend boundaries. The repository carries the exact methods and diagnostic data.

What this model covers

Modeled here

Realist, institutionalist, constructivist, and critical political economy reference profiles.

Under-modeled

Feminist, postcolonial and decolonial, green, and English School approaches are not named as scored families.

Diagnostic status

Structural sensitivity was tested with constructed inputs. No human participant or population inference follows from that diagnostic.

Raw posture scale

The registered restraint boundary is not a claim that the completed form is symmetrically centered around that raw value.
