R- Closest modeled tradition: Liberal Institutional

You think institutions, domestic filters, and strategic restraint matter a great deal, but you are not naive about power or capture.

One reference cell is marked, so this reading is a single archetype rather than a blend. The leading tradition sits well clear of Social Constructivist. The placement is stable enough to argue from.

Foundation archetype matrix

Four explanatory lenses, each shown in an applying-advantage and a restraint posture. The cells are reference points, not ranks.

	Power	Rules	Meaning	Structure
+ Applying advantage	 P+ Kairos	 R+ Grotian	 M+ Satyagraha	 S+ Dirigisme
- Restraint	 P- Shi (勢)	Your result  R- Concert	 M- Musyawarah	 S- Dependencia

Your Foundation reading

Concert R-

Normative orientation **Order-first**

Durable cooperation here depends on powerful actors accepting rules and restraint.

Why this result

简体中文

The nearest alternative is Constructivism. The family scores separate the two by 1.87 on the scale the model uses to rank families, which is wider than the threshold below which the reading would be reported as an undifferentiated placement.

An identity and legitimacy score of 5.1 shows that legitimacy and identity remain important in your answers, bridging institutionalism and constructivism. The difference is causal: you emphasize rules and monitoring more than identity per se.

The two dimensions doing the separating

Identity and legitimacy

Liberal Institutionalism reference reads neutral. Social Constructivist reference reads high.

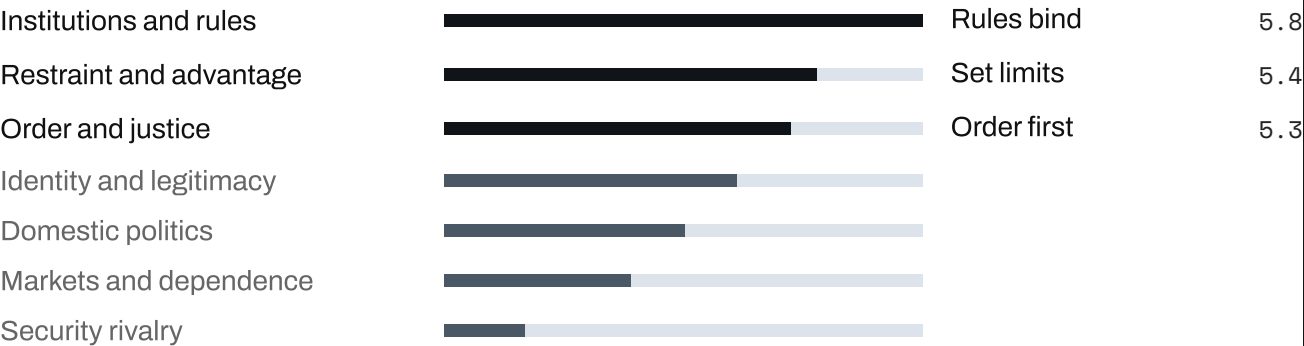

Institutions and rules

Liberal Institutionalism reference reads high. Social Constructivist reference reads neutral.

A different answer on identity and legitimacy, now 5.1, is what would move this reading toward Constructivism.

What carried the result

All seven dimensions are shown. The three that moved furthest from the midpoint are held at full contrast, and the remaining four are drawn back because they did less work here.

Your high score on institutions and rules aligned more closely with Institutionalism than with Constructivism.

Your high score on domestic politics aligned more closely with Institutionalism than with Constructivism.

Your high score on restraint and advantage aligned more closely with Institutionalism than with Constructivism.

The poles name the direction each dimension leans, from Power first to Rules bind on the strongest one.

Decisive choices

[简体中文](#)

This section needs the answers themselves, and a result link does not carry them.

A saved result link carries the seven dimension scores and the reading they resolve to. It carries no record of which option was taken on any item, so the choices behind this reading cannot be recovered from the link. Working through the Foundation in this browser leaves the answers on this device, and this section fills in from them.

Across the four domains

Each domain has its own item bank, its own scoring, and its own record. Nothing here adds them together.

Foundation	No record on this device.
-------------------	---------------------------

Security	No record on this device.
-----------------	---------------------------

Technology	No record on this device.
-------------------	---------------------------

AI Governance	No record on this device.
----------------------	---------------------------

No combined score is published across these four. No reviewed link between a domain axis and a Foundation dimension is published either, so a similar-looking pair of results is not evidence that the two measure the same thing.

Where this reading may fail

[简体中文](#)

You give rules real weight. The unresolved question is whether they still bite when powerful actors have both the motive and the means to defect.

The strongest objection

The constructivist challenge is that legitimacy and identity can change what actors think their interests are.

What the instrument does not model

Feminist, postcolonial or decolonial, green, and English School approaches are under-modeled here. The inventory may place those instincts near one of its four scored families without naming them directly.

Read methods and coverage limits

A case that would test it

When a verified arms-control regime later collapses, does that show that institutions failed, or that they worked only while the political bargain held?

The case separates faith in verification from faith that rules can survive a deeper strategic break.

INF Treaty Verification Regime. The 1987 INF Treaty eliminated an entire class of U.S. and Soviet ground-launched missiles and paired those obligations with one of the most intrusive verification systems then built into a nuclear arms-control agreement. Verification relied on data exchanges, national technical means, on-site inspections, and continuous monitoring. The regime was highly innovative, but the later collapse of the treaty shows that verification can reduce uncertainty without permanently solving underlying political conflict.
